Weak Acids Map

Edexcel International A Level Chemistry · Unit 4 · Topic 14B Weak Acids

1 Weak acids 14.6

- **Partially dissociated**
- $HA \rightleftharpoons H^+ + A^-$
- Equilibrium well to the left
- % dissociated = $[H^+] \div c \times 100$
- Weak ≠ dilute

2 K_a 14.8

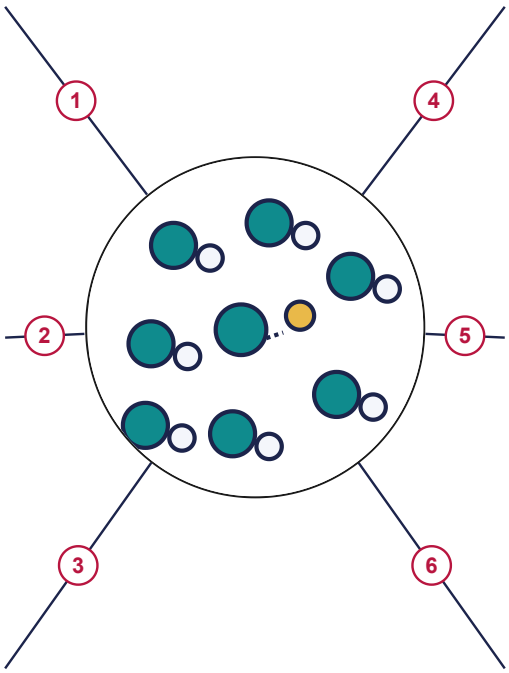

- $K_a = [H^+][A^-] \div [HA]$
- Equilibrium concentrations
- Units: **mol dm⁻³**
- No $[H_2O]$ term
- Larger K_a: **stronger**

3 pK_a 14.12

- $pK_a = -\log_{10}K_a$
- $K_a = 10^{-pK_a}$
- Ethanoic acid: 4.76
- Smaller pK_a: **stronger**
- 1 unit = ×10 in K_a

4 pH of a weak acid 14.9

- $[H^+] = [A^-]$ (water ignored)
- $[HA] \approx c$ (little dissociates)
- $[H^+] = \sqrt{(K_a \times c)}$
- Backwards: $c = [H^+]^2 \div K_a$
- Check: under about 5 %

5 Measuring pH 14.13

- **Calibrate** with buffers
- Compare **equimolar** solutions
- CH_3COONa alkaline; NH_4Cl acidic
- Dilute ×10: strong **+1.00**
- Weak: about **+0.5**

6 Finding K_a 14.14, 14.21, 14.23

- Known mass: $K_a = [H^+]^2 \div c$
- Half-neutralised: $[HA] = [A^-]$
- So $pH = pK_a$
- CP 11: titrate, neutralise,
- add equal acid, read pH

Some weak acids at 298 K

pH of 0.100 mol dm⁻³ solutions from $[H^+] = \sqrt{(K_a c)}$

Acid	pK_a	K_a / mol dm⁻³	pH (0.100 mol dm⁻³)
chloroethanoic acid, $CH_2ClCOOH$	2.86	1.38×10^{-3}	1.93 (estimate fails: 12 %)
methanoic acid, $HCOOH$	3.75	1.78×10^{-4}	2.38
benzoic acid, C_6H_5COOH	4.20	6.31×10^{-5}	2.60
ethanoic acid, CH_3COOH	4.76	1.74×10^{-5}	2.88
propanoic acid, CH_3CH_2COOH	4.87	1.35×10^{-5}	2.94

Worked examples

pH from pK_a

- 0.0500 mol dm⁻³ benzoic
- $[H^+] = \sqrt{(6.31 \times 10^{-5} \times 0.0500)}$
- **pH 2.75**

K_a from a mass

- 1.50 g CH_3COOH in 250 cm³
- c = 0.100; pH 2.88
- **$K_a = 1.74 \times 10^{-5}$**

Half-way

- equivalence 22.40 cm³
- pH at 11.20 cm³: 4.87
- **$pK_a = 4.87$**

Titration curves follow in Topic 14C; buffers, $pH = pK_a + \log([A^-]/[HA])$, in 14D.
